Branch Name: [D4-haley-wilson](#)

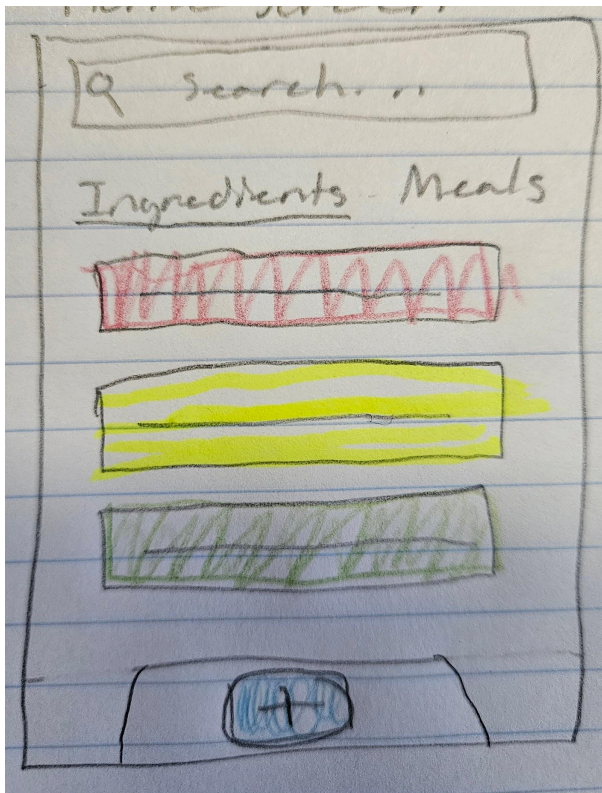

1. Low-Fidelity Wireframes (Mobile-First)

Insert/export images of your sketches or digital mockups. Each wireframe should be clearly labeled.

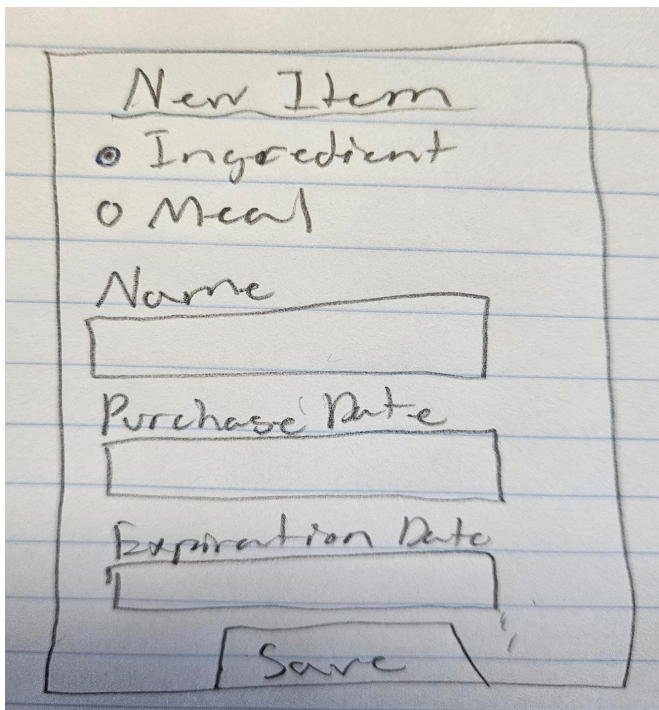

- Login Screen

- Home Screen

- Add New Item Manually Screen

2. Functional Requirements

Provide a bullet-point list of core app features. Be concise but detailed enough to show scope.

- **User authentication** (sign up with “Log into Google integration”, login, logout)
- **CRUD operations**[C: Add new ingredient (manually or scan); R: View all ingredients/filter by categories; U: Change ingredient’s details; D: Remove ingredient after it’s expired or used.]
- **Navigation between core pages** (Login Screen → Home Page→ Add custom item screen)
- **Home cooked meal tracking**
- **Barcode scanning integration**
- **Push notifications and reminders for food nearing expiration**

3. User Stories

1. As a home cook, I want to be able to log meals I have made from ingredients I already have so that I can track when the meal as a whole expires.
2. As a forgetful user, I want to receive push notifications before ingredients or meals expire so that they can be used/eaten in time.
3. As an organization freak, I want to be able to filter and search for my food by category so that I can find them quickly.

4. User Journey Flow

1. User opens app → sees login screen.
2. User chooses “Sign in with Google” and logs in successfully → redirected to Home Page[Shows ingredients that are about to expire soon at top; Tabs for “Ingredient” and “Meal” at top].
3. User presses “+” at bottom of screen) → Sees options to enter new item manually or scan a barcode.
4. User selects manually and enters item’s info [Name, purchase date, expiration date, details) → User saves the entry.
5. User clicks the “Ingredients” or “Meals” tab and confirms the new entry → User logs out and session ends.

[This is my individual submission. The team will review all submissions and agree on a final version for project continuation.]
