Ground beef  
onion water

Cooking style ✓

☒ baked

☐ canning

Storage style ✓

☐ freeze

## 2) Functional requirements:

**Login screen:** authorization, Api calls if logging in with gmail or facebook, call to the database for credential (key to key of course) validation

**Dashboard:** one stop shop to most\* of the CRUD operations, needs to be able to Read entries from the database, Have option to the Update(edit) function for each entry, and be able to to delete old meals; also has to call the Recalls api

**Account:** update the users information and such

**Meal Scan:** scan in retail food products to update(insert) entries into the database

**Meal Manual:** ability to add in personalized values for the entries into the database

## 3)3–5 detailed User Stories

- 1) as a busy college student, I need to know which food to eat first, to minimize food waste
- 2) as a consumer of pre-packed store bought food, i need to know if something [i own] is recalled, to minimize risk to myself and loved ones
- 3)as an young adult age with multiple devices, i need an account that i can access from anywhere not just my main device for convenience
- 4)as religious consumer i need to be able to have separate lists for specific meal requirements (halal, kosher, kosher for passover, lent) for specific holy periods
- 5) As someone who eats both store-bought and home-cooked meals frequently, I need to be able to both scan in my store-bought items for simplicity and manually add my home-cooked meals for specifics.

## 4) flow diagram or written description

\*note for reading the diagram, the api and database pictures refer to ANY instance of a call to either, not just specific ones
