

LIST OF UI SCREENS (non-exhaustive)

- Sign-in screen with “Log in with Google” integration
- Home page with recall notices, the item(s) closest to expiring, and the most recommended recipe idea
- A screen with the user’s complete list of items entered and when they expire
- Page to add a custom item to the tracker list
- Page to scan a UPC barcode to find existing item information
- Account settings page

FUNCTIONAL REQUIREMENTS

- To authenticate users signing in or registering via Google, a call to the OAuth API is required.
- Signing up will call the CRUD Add operation on a user list. Signing in will Read from that list.
- On the Account tab, modifications to the account settings and deletion of the user’s account will call the CRUD Update and Delete operations on the user list, respectively.
- The Home, List, and Recipe tabs will utilize CRUD Read operations and various API calls to display the user’s saved items, recall information, estimated expiration dates, lot numbers, and other item information.
- Adding an item to the user’s item list requires a CRUD Add operation. Use of UPC barcode processing and referencing lot numbers can cause various API calls.

USER STORIES

- As a new user, I need to be able to sign up with Google, other email, or cell phone so that my leftovers and other saved material can be accessed from any device.
- As a fast casual diner, I need to be able to save leftovers from restaurants so that I can estimate the shelf life of those leftovers that don’t have expiration dates printed on them.
- As a busy college student, I need to be able to find the item closest to expiring first so that I can quickly eat it before it expires.

- As a grocery shopper, I need to be able to estimate produce expiration dates, since produce generally isn't marked with a solid expiration date.
- As a user, I need to be able to quickly access recall information, so that I don't use food that could make me sick because it was listed on a recall notice.
