

Deliverable 4

1. Functional Requirements

- User authentication system
- CRUD operations for tracking stored meals
- Access to USDA API for food recall information

2. User Stories

- As a user I want to be able to track my food I am storing to be able to receive information about expiration dates.
- As a user I need to be able to receive recall information from the USDA about food I am storing so I can avoid food poisoning
- As a user I need to be able to sign in to the application so the app can track user information and food individually.
- As a user I want to be able to see all of my currently stored meals sorted by order of spoil time so that I can make an informed decision on what to eat to save food and money.

3. User Journey

Whenever the user first comes into an application they will be asked to login on a sign in page. After logging in the user will be taken to a dashboard that will allow the user to access all of the other relevant pages on the application such as a page with a list of all of their entered food items, a page to add a custom home cooked meal, and a page to scan a food item into the system.

However the dashboard will also contain other important information such as pop ups about recalled food and food that will soon expire to allow users to make informed decisions.

As for the other pages, here is a brief description of each:

- **Food List Page:** contains a list of all food currently stored by the user and its expiration date. By default this page will be sorted by order of expiration date.
- **Custom Meal Page:** allows users to enter home cooked meals into the system by providing the application with a list of ingredients that the system will use to determine a reasonable expiration date.
- **Scan Page:** allows users to use their phone camera to scan food items into the system smoothly and easily.
